

Ekiyor Clifford

Full Stack Developer — AI-Integrated & Backend-Focused Systems

✉ ekiyorclifford@gmail.com ● Nigeria ● [Portfolio](#) ● [GitHub](#) ● [Spark](#) ● [Serein](#) ● [Hestia](#)

PROFILE

Full stack developer building full-stack applications since 2024, focused on backend-driven systems where users, data, and workflows interact reliably. Experience spans multi-role systems and AI-integrated products that turn language-model output into structured, production-ready features.

PROJECTS

[Spark](#) — AI Product Co-Pilot · 2026

- Built a full-stack AI tool (Next.js, TypeScript, Groq LLM API) that turns a rough product idea into a structured, refineable MVP brief.
- Designed a prompt-engineered output pipeline producing consistent sections: problem, target user, prioritized features with testable acceptance criteria, stack recommendation, and a 2-week build plan.
- Implemented a multi-step product loop (generate → clarifying questions → refine) rather than one-shot generation.
- Shipped server-side LLM streaming with the API key never exposed client-side, plus rate limiting, server-side share links with author attribution, and exportable Markdown output.

[Serein](#) — Full-Stack Booking Platform · 2026

- Built a full-stack booking platform (Next.js, TypeScript, Supabase, Paystack) with dual customer/admin authentication.
- Implemented live availability tracking to prevent double-bookings, and end-to-end Paystack payment integration from checkout to confirmation.
- Built an operations dashboard giving admins visibility into bookings, availability, and payment status in one place.

[Hestia](#) — Rental Platform System · 2025–2026

- Designed and built a multi-role rental platform (Tenant, Landlord, Admin) with role-based access control and dashboards, mentored by senior engineers at Moat Academy.
- Implemented custom PHP authentication and session management, with full CRUD operations across 8–12 relational tables.
- Built an approval-based rental workflow for landlord-controlled tenant access; tested with 12 users and 20+ listings.
- Improved performance by ~25–40% through query and structural optimization; refactored into modular architecture for scalability.

Discord Automation Bots — Node.js, Discord.js · 2024

- Built moderation and monitoring bots for a ~340-user server, including a REST API stats endpoint.
- Added auto-restart and error-recovery systems for reliability in a long-running, unattended service.

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, PHP

Frameworks: Next.js, React, Laravel, Discord.js

Databases: PostgreSQL, MySQL, Supabase

AI / APIs: LLM API integration (Groq), prompt engineering, Paystack, REST API design

Tools: Git, GitHub Actions (CI/CD), Node.js, Express

EXPERIENCE

MOAT Academy — Backend Development Training · Dec 2025 – Mar 2026

- Focused on PHP and backend systems; built real-world structured applications including Hestia.

CERTIFICATIONS

W3Schools — JavaScript, PHP, Next.js
